

Project Management

Project Management helps you structure your procurement process, gain better visibility of sourcing projects, and provide you with a roadmap that is easy to follow from project start to end.

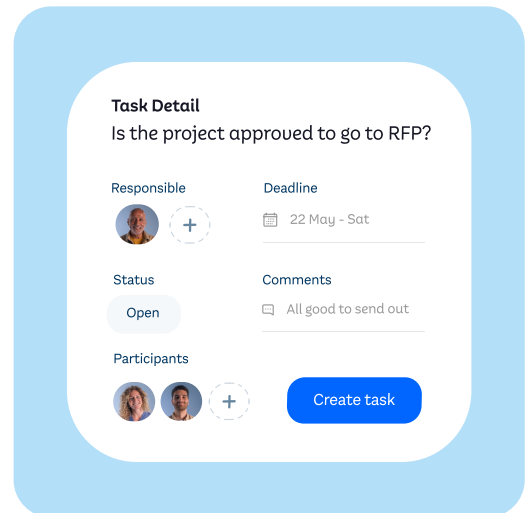

Communicate Directly with Your Stakeholders

Gain full visibility of all existing projects via single shared project repository for all notes, files and communication ensuring the team is aligned, all stakeholders are aware of their contribution and clear, organized plans are in place to improve team collaboration.

Everything in One Integrated Solution Hub

Scanmarket Project Management provides an overview of company initiatives across all departments – tracking project status, savings and keeping all participants informed.

Strategic sourcing projects within defined workflows stores information such as notes, documents, tasks, and communication, whilst ensuring full compliance and traceability resulting in a streamlined process.

Define Your Processes and Templates

The Project Management software is 100% flexible when defining your project process and templates, and you can define the processes in the most suitable way for your procurement team – whether that is using a standard 7- or 10-step process - or any custom process.

When defining project templates, you can create groups and fields to your liking. You can store any data on a project template including key stakeholders, standard documents, or pre-defined tasks and define any field as mandatory.

Scanmarket has provided Scandlines with a platform on which we can build Sourcing 2.0. By increasing transparency, cost efficiency and stakeholder satisfaction, we are digitizing sourcing processes and thereby maximizing output from each sourcing event.

Andreas Fries Jørgensen, Category Task Manager, Scandlines

Everything You Need to Know in One Place

Integrated solution hub

As all Scanmarket products are fully integrated, all aspects of the Source-to-Contract cycle can be managed from the Project Management product, including sourcing, negotiation, award, contracting, performance management and savings tracking, and all stakeholders can be invited to participate and communicate through this central hub.

Visibility of all projects

Gain complete overview of all projects and the associated progress, status, stakeholders, stage, notes, metadata, and documents.

Best-practice process deployment

Define and deploy fully customized best-practice processes and workflows for users to follow with stages, tasks, guidelines, metadata fields, etc., to enhance sourcing, supplier management, risk assessments and contract management.

Data-driven benchmarking & continuous improvement

Due to the flexibility of the system, any required metadata can be collected and then reported on. This richness of data enables organizations to benchmark themselves using their current baseline against any key metrics, and continuously improve strategies from data-driven insights.

Project plan and resource allocation

Manage and plan your project pipeline and resources by allocating projects and tasks to internal and external stakeholders.

It has been paramount for us to use this project management approach to ensure we cover risks and have proper stakeholder alignment.

In Group Sourcing (DT Group) we use an 8-step project management process for sourcing projects. We have had some very successful sourcing projects over the years resulting in a better bottom line. As such we have chosen to include Scanmarket's Project Management module in our license with them.

Patrick Jonsson, Manager of Sourcing & Business Strategy, DT Group
